Time Is Money: Methods to Measure and Reduce Survey Burden

Bryan Wu, Kaiser Family Foundation

Special thanks to these AAPOR presenters for the following slides: Robin Kaplan, Jennifer Kelley, Victoria Porterfield, Jerry Timbrook, and Georg-Christoph Haas

PAPOR Annual Mini-Conference
June 29, 2018
Presentation Outline

1. How Do We Define Survey Burden?
2. How Do We Measure Burden and Identify its Correlates?
3. How Can We Make Efforts to Reduce Burden?
A Diagnostic Mechanism for Assessing Respondent Burden: Sensitive Item Nonresponse Bias in Student Surveys

Victoria Porterfield, Ph.D
Marc D. Weiner, J.D., Ph.D
Paul Siracusa, M.P.P

Edward J. Bloustein School of Planning and Public Policy
Rutgers-New Brunswick
Context: Institutional Review Boards [IRB]

- **National Research Act of 1974:**
  - Every federally funded university in the United States and conducts research is required to have an institutional review board (IRB);
  - Regulations put in place as a response to various misuses of humans in experiments and studies.

- **Fast forward to present day:**
  - Survey research is considered human subjects research;
  - Sometimes what is considered ‘sensitive’ is vague and outdated, but often times it is not;
  - How do IRBs determine what is sensitive?
    - This study provides insight into what might (and might not) be considered sensitive.
### Results

<table>
<thead>
<tr>
<th>Probability of Sensitive Item Response</th>
<th>Income</th>
<th>Religion</th>
<th>Sexual Orientation</th>
<th>Political Affiliation</th>
</tr>
</thead>
<tbody>
<tr>
<td>International</td>
<td>.9074</td>
<td>.9722</td>
<td>.8241</td>
<td>.9583</td>
</tr>
<tr>
<td>Domestic</td>
<td>.9465</td>
<td>.9887</td>
<td>.9413</td>
<td>.9773</td>
</tr>
<tr>
<td>Asian International</td>
<td>.9128</td>
<td>.9767</td>
<td>.8081</td>
<td>.9593</td>

<tr>
<td>Domestic and NonAsian International</td>
<td>.9461</td>
<td>.9885</td>
<td>.9409</td>
<td>.9772</td>
</tr>
</tbody>
</table>

- Mean INRR for sexual orientation was 5.4%; International was 14.0%.
- Mean INRR for income was 4.8%; International was 7.4%.
How Do We Define Survey Burden?
Types of Survey Burden

1. Respondent-related
   - Objective measures
   - Subjective measures

2. Interviewer-related
   - Deviations from question wording
Survey features and respondent characteristics that contribute to objective and subjective measures of burden

Robin Kaplan and Scott Fricker
Bureau of Labor Statistics, Office of Survey Methods Research
AAPOR 2018

*Disclaimer: This presentation is released to inform interested parties of ongoing research and to encourage discussion of work in progress. Any views expressed are those of the author(s) and not necessarily those of the BLS
Objective Measures of Respondent Burden

- Time to complete survey:
  - Survey length
  - Number of questions
  - Frequency of survey
  - Time reading instructions
  - Time gathering and entering data
  - Time reviewing data
Subjective Measures of Respondent Burden

- Appraisal of how burdensome the survey experience was, for example:
  - Effort
  - Motivation
  - Interest
  - Sensitivity

- "How burdensome did you find this survey?"
Question Characteristics and Interviewer Question-Reading Deviations

Jennifer Kelley
University of Essex

AAPOR 73rd Annual Conference
May 16th, 2018
Why do interviewers go off script?

• Simple error
• Tailor question to respondent to signal they are listening
• Dealing with uncooperative/tired respondent
• Lack of training
• Personal gain (e.g., paid by the interview)
• Trying to “help” respondent
• “Fix” the question
How Do We Measure Burden and Identify its Correlates?
Survey features and respondent characteristics that contribute to objective and subjective measures of burden

Robin Kaplan and Scott Fricker
Bureau of Labor Statistics, Office of Survey Methods Research
AAPOR 2018

*Disclaimer: This presentation is released to inform interested parties of ongoing research and to encourage discussion of work in progress. Any views expressed are those of the author(s) and not necessarily those of the BLS
Research Questions

- What survey/respondent characteristics contribute to objective & subjective burden? How does burden affect data quality?
  - Does respondents’ level of engagement / survey fatigue affect burden? (e.g., McCalin et al., 2015)
  - Does the order of the subjective burden questions affect respondent ratings of the survey? (e.g., Schwarz et al., 1991)
Study Design
(single web survey ~20 min)

1. Activity log task
2. Survey questions about typical time use
3. Level of engagement questions
4. Subjective burden ratings
5. Demographic questions
Objective Burden Measures

Average time on survey

Average time on activity log

Engagement measure

Please indicate to what degree you were having each experience described below while you completed the survey. Please answer according to what really reflected your experience rather than what you think your experience should have been. [1 strongly disagree to 5 strongly agree]

1.) I was finding it difficult to stay focused on the survey.
2.) I was doing the survey without paying attention.
3.) I was preoccupied with the future or the past.
4.) I was doing the survey automatically, without being aware of what I was doing.
5.) I was rushing through the survey without really being attentive to it.

Objective Burden Outcomes

Average time on survey* 20.89 min (SD = 22.70)
Average time on activity log 6.69 min (SD = 5.13)

*Removed n=17 outliers (participants who took more than 3 standard deviations above the average time to complete the survey)

** Note: Adjusted $R^2$=.47; $F(18, 985) = 48.76$, $p < .001$ at Step 4.
Summary

Objective:
- Fatigue
- Education level
- Time on detailed task

Subjective:
- Perception of length
- Gender
- Effort
- Survey engagement
- Interest in topic
- Sensitivity in topic

Data quality

U.S. Bureau of Labor Statistics • bls.gov
Conclusions & Future Directions

Conclusions

- More than just time contributed to data quality outcomes
- Easing respondent burden
  - Survey engagement/interest

In the future:

- Burden as a complex, multi-component concept
- Continue to assess objective and subjective burden within surveys to better understand burden and its relationship to data quality, survey outcomes
Question Characteristics and Interviewer Question-Reading Deviations

Jennifer Kelley
University of Essex

AAPOR 73rd Annual Conference
May 16th, 2018
Research Question

Are there certain question characteristics that increase the odds of interviewers engaging in major question-reading deviations in face-to-face interviews?
Data

• Wave 3 of the Understanding Society Innovation Panel, U.K.
  • Multi-stage probability sample
  • Social and economic topics

• 1621 CAPI interviews

• Interviewers are trained to read all questions verbatim

• Sections of the interview were recorded with permission of respondent
  • 1167 respondents gave consent

• Interview recordings
  • 820 recordings were available for analysis

• Interviewers were told which sections would be recorded
Methods: Sample

• Randomly selected two recorded interviews from each interviewer (n=80) and behavior coded all selected questions in the recording

• Selected questions based on following criteria
  • Question was intended to be read out loud
  • Did not contain ‘fills’
  • Were administered to both males and females
  • Had same response options for all regions

• If the two interviews selected for the interviewer did not result in a minimum of 50 questions, a third interview was selected

• 10,345 questions
Methods: Behavior Coding for Question-Reading

• Interviewer’s first reading of the question was coded

• Verbatim or Deviation

• Magnitude of deviation
  • Minor – does not change question meaning
  • Major – changes question meaning

<table>
<thead>
<tr>
<th>Question Reading (n=10345)</th>
<th>%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verbatim</td>
<td>52.5</td>
</tr>
<tr>
<td>Minor Deviation</td>

Analysis Methods

• Bivariate analysis to assess the relationship between the question characteristics and major deviations

• Logistic multi-level model
  • Three levels: where $n$ questions (Level 1) are nested within respondents (Level 2) nested within interviewers (Level 3)
  • Outcome variable: Major question-reading deviation
  • Predictor variables: 19 Question Characteristics
  • Control variables: Respondent and Interviewer level variables (next slide)
  • Estimated using RIGLS (PQL-2) in MLwiN 3.01
  • Presenting odds ratios
Methods: Control Variables

- **Respondent Characteristics**
  - Age
  - Education
  - Married
  - Employed
  - Number of Children in Home
  - Nationality (British/Other)
  - Cognitive Ability
  - Completed Interview Last Wave

- **Interview Context**
  - Interviewer’s Assessment of R's Understanding
  - Interviewer’s Assessment of Resistance
  - Other Present
  - Number of Interviews Same Day

- **Interviewer Characteristics**
  - Age
  - Nationality (British/Other)
  - Experience
  - Average Number of Interviews per Day

**** ****p<0.0001
Discussion

• Questions with definitions/examples and questions with response options read as part of the text have the highest odds of question-reading deviations

• Question aids may be doing more harm than good

• Questionnaire designers need to be aware of the risks
  • May want to redesign question
  • When training interviewers, draw attention to these types of questions and convey importance of reading the questions verbatim

• Next steps
  • Look at interactions
  • Other respondent or interviewer characteristics
The Effects of Question Complexity and Necessary Question Features on Interviewer and Respondent Contributions to Response Time

Jerry Timbrook
Kristen Olson
Jolene Smyth
University of Nebraska-Lincoln
AAPOR, May 2018
Response Times

• The problem:
  • Active timers aggregate respondent and interviewer contributions to response time
    • Cannot investigate respondent and interviewer contributions to response time separately
  • Factors affecting response time (e.g., question characteristics) may affect respondents and interviewers differently
    • Actors have different jobs and different cognitive processes
Factors Affecting Response Time

• In this study, we:
  • Use a new timer method
    • Audio record and code respondents’ and interviewers’ contribution to response time separately
  • Explore the effect of:
    1. Respondents’ answering device
    2. Essential question features
    3. Question complexity
  • Compare new method to the previous “total time of both actors” approach
    • Assess the benefits of decomposing response time by actor
Data

• **US/Japan Newspaper Opinion Poll**
  • National telephone survey of U.S. adults conducted by Gallup in Nov 2013.
  • Landline and Mobile, AAPOR RR1 = 7.4%
  • Stratified random subset of 434 interviews were recorded and transcribed
    • 249 landline respondents, 185 mobile respondents
Data

• **DV**s:
  • Total Time:
    • Both Actors Spent on Each Question
    • Respondents Spent on Each Question
    • Interviewers Spent on Each Question
  • Calculated using Sequence Viewer (Dijkstra 1999)
  • 73 items
    • 29,514 Total times (seconds)
    • 29,514 Respondent times (seconds)
    • 29,514 Interviewer times (seconds)
• **IV: Respondent’s survey completion device**
  - Coded from respondent self-reports (=0 landline; =1 cell phone)

• **IV: Necessary Question Features**
  - Number of words in the stem and response options
  - Interviewer instructed to read response options? (=0 no; =1 yes)
  - Question type (=0 Attitude/Opinion; =1 Factual)
• IV: Question Complexity
  • Reading Level (Flesch–Kincaid Grade Level)
  • Item-Level indicators of QUAID-identified problems:
    • Uncommon Technical Terms (n=42)
    • Vague Words (n=36)
    • Complex Syntax (n=3)
    • Working Memory Overload (n=11)

• Controls:
  • Respondent age and education, interviewer tenure
Factors Affecting Response Time

• **Respondents’ Answering Device**
  • Cell phone interviews last longer than landline interviews *(Kennedy & Everett 2011; Lynn & Kaminska 2012; Timbrook et al. forthcoming)*
  • **Issues with line quality** *(Timbrook et al. forthcoming)*
    • Affects actors’ ability to hear and understand one another
  • Only investigated at survey level

• **Hypotheses:**

<table>
<thead>
<tr>
<th>Respondent Total Time</th>
<th>Interviewer Total Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cell Phone &gt; Landline</td>
<td>Cell Phone &gt; Landline</td>
</tr>
</tbody>
</table>
Factors Affecting Response Time

• Necessary Question Features
  • Longer questions take longer to administer (Yan and Tourangeau 2008; Couper and Kreuter 2013; Olson and Smyth 2015)
    • More words and more response options
    • Interviewer reading response options?
  • Question Type:
    • Attitude questions take longer than factual questions (e.g., demographics)
  • Hypotheses:

<table>
<thead>
<tr>
<th>Respondent Total Time</th>
<th>Interviewer Total Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Longer Questions &gt; Shorter Questions</td>
<td>Longer Questions &gt; Shorter Questions</td>
</tr>
<tr>
<td>Read RO = Don’t Read RO</td>
<td>Read RO &gt; Don’t Read RO</td>
</tr>
<tr>
<td>Attitude &gt; Factual</td>
<td>Attitude = Factual</td>
</tr>
</tbody>
</table>
Factors Affecting Response Time

• **Question Complexity**
  
  • More complex questions have longer response times in:
    
    • Web (Yan & Tourangeau 2008)
    • Face-to-face (Couper & Kreuter 2013)
    • Landline CATI surveys (Olson & Smyth 2015)
Factors Affecting Response Time

• **Question Complexity**
  • **Question Understanding Aid (QUAID)** (Graesser et al. 2006)
    • Identifies problems with a question that may affect respondent comprehension
    • Measures:
      • Uncommon technical terms
      • Terms with vague meanings (e.g., *many, few*)
      • Complex syntax
      • Working memory overload
Factors Affecting Response Time

• **Question Understanding Aid (QUAID)** (Graesser et al. 2006)

  • How might questions with QUAID-identified problems affect cognitive processing?
    • Respondents
      • Higher working memory burden in telephone surveys (de Leeuw 2005; Dillman et al. 2014)
    • Interviewers
      • Question asking (Japec 2008; Dykema et al. 2017)
      • Feedback (Japec 2008)

• **Hypotheses:**

<table>
<thead>
<tr>
<th>Respondent Total Time</th>
<th>Interviewer Total Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUAID-identified Problem &gt; No Problem</td>
<td>QUAID-identified Problem &gt; No Problem</td>
</tr>
</tbody>
</table>
Factors Affecting Response Time

• **Question Complexity**

  • Question reading level
    • Higher reading levels (harder to understand) = longer response times (Yan & Tourangeau 2007; Olson & Smyth 2015)

• Hypotheses:

<table>
<thead>
<tr>
<th>Question Type</th>
<th>Hypothesis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Respondent Total Time</td>
<td>↑ Reading Level &gt; ↓ Reading Level</td>
</tr>
<tr>
<td>Interviewer Total Time</td>
<td>↑ Reading Level &gt; ↓ Reading Level</td>
</tr>
</tbody>
</table>
Modeling Approach

• Cross-classified random effects models

\[ \log(Y_{i(j_1,j_2)k}) = \gamma_{0000} + v_{000k} + u_{010k} + u_{002k} + \varepsilon_{i(j_1,j_2)k} \]

• Estimate models predicting:
  • log(Total Time on a Question)
  • log(Respondent Time on a Question)
  • log(Interviewer Time on a Question)
## Results

How Can We Make Efforts to Reduce Burden?
Assessing the Effect of the Web Mode on Response Burden in Establishment Surveys

AAPOR, May 17th 2018

Georg-Christoph Haas
(IAB Nuremberg, Germany)

Stephanie Eckman
(RTI International)

Ruben Bach
(University of Mannheim, Germany)

Frauke Kreuter
(IAB Nuremberg, Germany)
Response Burden Model (Haraldsen 2004)

- Respondents characteristics
- Perceived burdens and gratifications
- Survey properties
- Response Quality

Web vs mail mode

- Mode
- Content
- Questionnaire length
- Survey Organisation
- Publicity
- Implementation
- Strategy
- Content
- Layout
- Communication strategy
- Sample design
The Effect of Web on Response burden

Increase Burden

- Poor online skills
- Poor web survey design
- Plausibility checks

Decrease Burden

- Invisible filters
- Counting and calculating
- Paperwork burden
- Access information more quickly
Data

- Sample drawn from German admin records (16,000)
  - Stratified by size, location and industry class

- 3 different mode conditions

- 1,574 completes (AAPOR RR1: 10.2 %)
## Experimental Design

<table>

RQ 1: Mail vs Web

RQ 2: Mail vs Web, Choice impacts response burden

RQ 3: Web vs Web of Choice, Choice impacts response burden
Dependent Variables (Dale et al 2007)

- **Estimated Time** (in minutes)
  - Time to gather needed information
  - Time to complete the questionnaire

- **Perceived Burden** (5 Item scales)
  - Perceived time (very quick – very time consuming)
  - Perceived burden (very easy – very burdensome)

The Effects of Question Complexity and Necessary Question Features on Interviewer and Respondent Contributions to Response Time

Jerry Timbrook
Kristen Olson
Jolene Smyth
University of Nebraska-Lincoln
AAPOR, May 2018
Factors Affecting Response Time

• **Question Complexity**
  - **Question Understanding Aid (QUAID)** (Graesser et al. 2006)
    - Identifies problems with a question that may affect respondent comprehension
    - Measures:
      - Uncommon technical terms
      - Terms with vague meanings (e.g., *many, few*)
      - Complex syntax
      - Working memory overload
Conclusions – Question Complexity

• For respondents, questions with QUAID-identified problems and reading level had no effect on response time
  • Some respondent processing time absorbed by interviewer speaking time?

• Interviewers take longer on questions with QUAID-identified problems and higher Reading Levels
  • Interviewers are doing the “spoken work” for these problematic questions
  • Use the QUAID tool and reading level to evaluate and revise questions to reduce burden
Concluding Remarks

1. There are a number of ways to define and characterize survey burden
   • We tend to think of it in terms of respondents’ experiences when completing a survey, but burden can also be associated with the interviewer

2. Many methods to measure burden as well as identify the features of the survey and characteristics of respondents and interviewers that are correlated with it
   • For example, reading response options ↑ reading deviations and reading time

3. Some possible ways to reduce burden
   • Implementing QUAID and testing out different survey modes
Thank you.
